```
text2pdf [options] [filename]

   text2pdf makes a 7-bit clean PDF file (version 1.1) from any input file.
   It reads from standard input or a named file, and writes the PDF file
   to standard output.

   There are various options as follows:

  -h             show this message
  -f<font>       use PostScript <font> (must be in standard 14, default: Courier)

  -I             use ISOLatin1Encoding
  -s<size>       use font at given pointsize (default 10)
  -v<dist>       use given line spacing (default 12 points)
  -l<lines>      lines per page (default 60, determined automatically
                 if unspecified)
  -c<chars>      maximum characters per line (default 80)
  -t<spaces>     spaces per tab character (default 8)
  -F             ignore formfeed characters (^L)
  -A4            use A4 paper (default Letter)
  -A3            use A3 paper (default Letter)
  -x<width>      independent paper width in points
  -y<height>     independent paper height in points
  -2             format in 2 columns
  -L             landscape mode

  Note that where one variable is implied by two options, the second option
  takes precedence for that variable. (e.g. -A4 -y500)
  In landscape mode, page width and height are simply swapped over before
  formatting, no matter how or when they were defined.
